

CASE 2021-9

Diagnostic Slide Session

AANP 2021

6/12/2021

CASE 2021-9

Clinical History:

- 60 year old female, non-smoker
- no prior history of malignancy or occupational exposures
- Presentation: headache and new onset vision loss in left eye
- Unresponsive to antibiotics and steroids
- Imaging : midline skull base lesion centered within the ethmoid sinus with involvement of the cribriform plate and orbital apex

CASE 2021-9

CASE 2021-9

- Audience discussion

CK5/6

p63

p40

p16

Immunohistochemical stains

POSITIVE

- CK903
- CK7
- CK5/6
- p40
- P63
- INI-1 (retained)
- (additional (next slide))

NEGATIVE

- Synaptophysin
- Chromogranin
- TTF-1
- PAX-8
- p16 (no block-like reactivity)

NUT

CASE 2021-9

- Diagnosis: NUT carcinoma
(formerly NUT midline carcinoma)
- Rearrangement involving NUTM1 gene, 15q14
- NUT fusion protein
- Detectable by IHC (sufficient for diagnosis)
 - >50% tumor nuclei in FFPE tissue

CASE 2021-9

- Frequently misdiagnosed poorly differentiated carcinoma
- Hallmarks: monotony and abrupt keratinization
- Differential diagnosis:
 - Poorly differentiated SCC
 - Ewing sarcoma
 - Hematopoietic neoplasm
 - Sinonasal undifferentiated carcinoma
 - Esthesioneuroblastoma
 - SMARCB1-deficient sinonasal carcinoma

CASE 2021-9

- Any age group, not restricted to midline
- Poor prognosis, poor response to traditional therapies
- Genetic rearrangement involving NUTM1 → gene fusion (BET-NUTM1) → NUT fusion oncoprotein
- Targeted therapies under investigation
 - BETi
 - HDACi

CASE 2021-9

- When to test for NUT?
 - **All poorly differentiated non-cutaneous carcinomas with a monomorphic appearance**
 - No association with HPV or EBV (of note, p16 IHC positivity in NUT may be misleading), so presence of confirmed viral etiology is enough to exclude

CASE 2021-9
