

63rd ANNUAL DIAGNOSTIC SLIDE SESSION 2022

CASE 2022 [#11]

Submitted by: Dr. Anthony Tuzzolo and Dr. Jesse Lee Kresak
University of Florida Health-Shands, 1600 Southwest Archer Road, Gainesville, FL, 32608

Clinical History:

45-year-old woman presented to an outside institution with non-specific neurological symptoms. Imaging studies demonstrated a 4.6 cm mass within the right frontal horn of the lateral ventricle. The mass extended into the right frontal lobe and exhibited a significant amount of surrounding vasogenic edema. The case was received in consultation.

Material Submitted: H&E section of the mass and radiographic images

Points for discussion:

1. Diagnosis and differential.
2. Relative incidence of the entity in question.
3. Possible considerations for pathogenesis.
